

WAYS MOLECULES MOVE

Chapter 7-3

See a [video clip](#) about
DIFFUSION-7A

Diffusion

Molecules move

FROM "where there's A LOT"
to "where there's NOT"

DIFFUSION across a space

Happens anytime there is a DIFFERENCE in concentration in one place compared to another

= Concentration gradient

DIFFUSION across a SPACE

Molecules move automatically DOWN the concentration gradient from an area of Higher concentration to an area of Lower concentration

• EXAMPLES

Blue dye in beaker demo,
Someone making popcorn/grilling out
Strong perfume,
Bad smell in room

DIFFUSION across a space

Diffusion continues until the concentration is equal everywhere in space

= Equilibrium

Movement of molecules across the cell membrane “Transport”

High to Low

Passive transport

No energy

Simple diffusion

Facilitated diffusion

Low to high

Active transport

Requires energy

Diffusion can happen across a membrane in a cell, too

Diffusion across a membrane

...as long as membrane will let the molecule pass through

CELL EXAMPLE:

DIFFUSION automatically moves oxygen from **HIGHER** concentration (in lungs) to a **LOWER** concentration (in blood)

CO₂ automatically moves from where there is a **HIGHER** concentration (in blood) to where there is a lower concentration (in lungs)

PROBLEM for CELLS?

Diffusion only moves molecules from high concentration to low concentration.

What if cell needs to move a molecule AGAINST the **CONCENTRATION GRADIENT?**

(LOWER → HIGHER)

Cell example:

Want to put **MORE** glucose into mitochondria when there is already glucose in there

PROBLEM for Cells?

Cell membranes are SELECTIVELY PERMEABLE

[See a movie](#)

What if a cell needs to move LARGE or POLAR molecules that can't get through the membrane?

PROBLEM for CELLS?

Diffusion happens very slowly

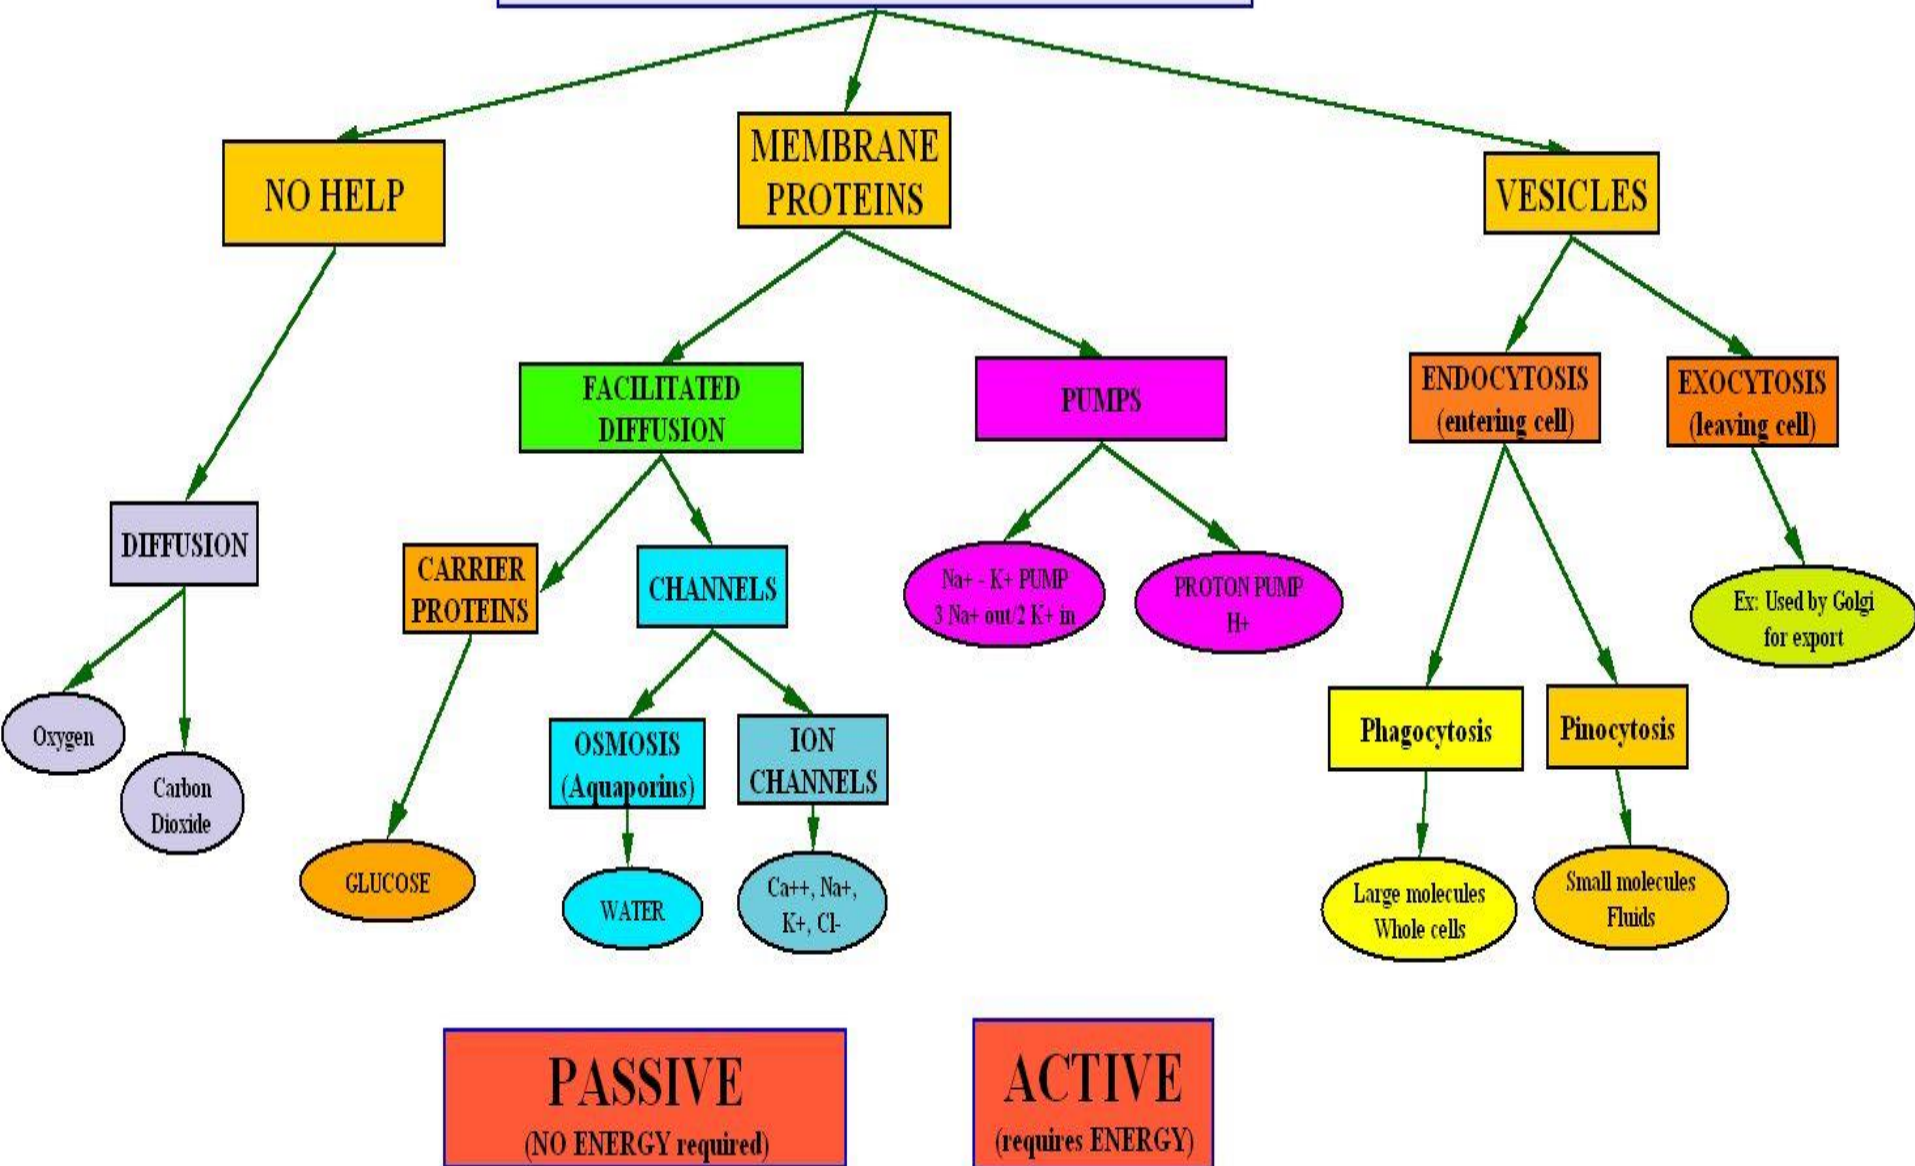

What if cell needs to move molecules really FAST ?
(can't wait for it to diffuse)

Cell example:
Movement of Na^+ & K^+ ions required to send nerve signals

Cells need a WAY to
HELP molecules across
cell membranes that
can't go across by
themselves

KINDS OF TRANSPORT

6

Passive and Active Transport

See a [video](#) about Passive transport 7-C

Kinds of PASSIVE Transport

- Diffusion

- Facilitated Diffusion

 - Carriers

 - Channels

DIFFUSION across a membrane

Happens anytime there is a DIFFERENCE in concentration on one side of the membrane compared to the other

See diffusion
animation

DIFFUSION

- No energy required = PASSIVE
- Moves DOWN concentration gradient from HIGHER to LOWER
- Works for any molecules that can pass through the membrane
- Example of molecules that move this way in cells:
OXYGEN & Carbon dioxide

FACILITATED DIFFUSION

uses membrane proteins to help molecules across

2 kinds of proteins help:

Carriers

&

Channels

Animations from: <http://bio.winona.edu/berg/ANIMTNS/facdifan.gif>

<http://www2.uic.edu/~myilma1/ionchannel.gif>

Facilitated Diffusion with CARRIER PROTEINS

Animation from: <http://bio.winona.edu/berg/ANIMTNS/facdifan.gif>

Carrier protein
grabs molecule,
changes shape, and
flips across to
other side like a
revolving door

FACILITATED DIFFUSION with CHANNELS

<http://bio.winona.edu/berg/ANIMTNS/voltgate.htm>

Membrane proteins create a tunnel through which molecules can pass

ION CHANNELS allow charged ions to get past the hydrophobic center

FACILITATED DIFFUSION with CHANNELS

Aquaporin proteins allow polar
WATER molecules to get past
the hydrophobic middle of cell
membrane.

FACILITATED DIFFUSION with CHANNELS

The movement of water molecules
across a cell membrane is called
OSMOSIS

ALL KINDS OF FACILITATED DIFFUSION

- No energy required = PASSIVE
- Moves DOWN concentration gradient from HIGHER to LOWER
- Membrane proteins help molecules get across membrane

EXAMPLES OF FACILITATED DIFFUSION IN CELLS

- CARRIER PROTEINS

GLUCOSE

- ION CHANNELS

Na^+ , Cl^- , Ca^{++} , K^+

- AQUAPORINS (OSMOSIS)

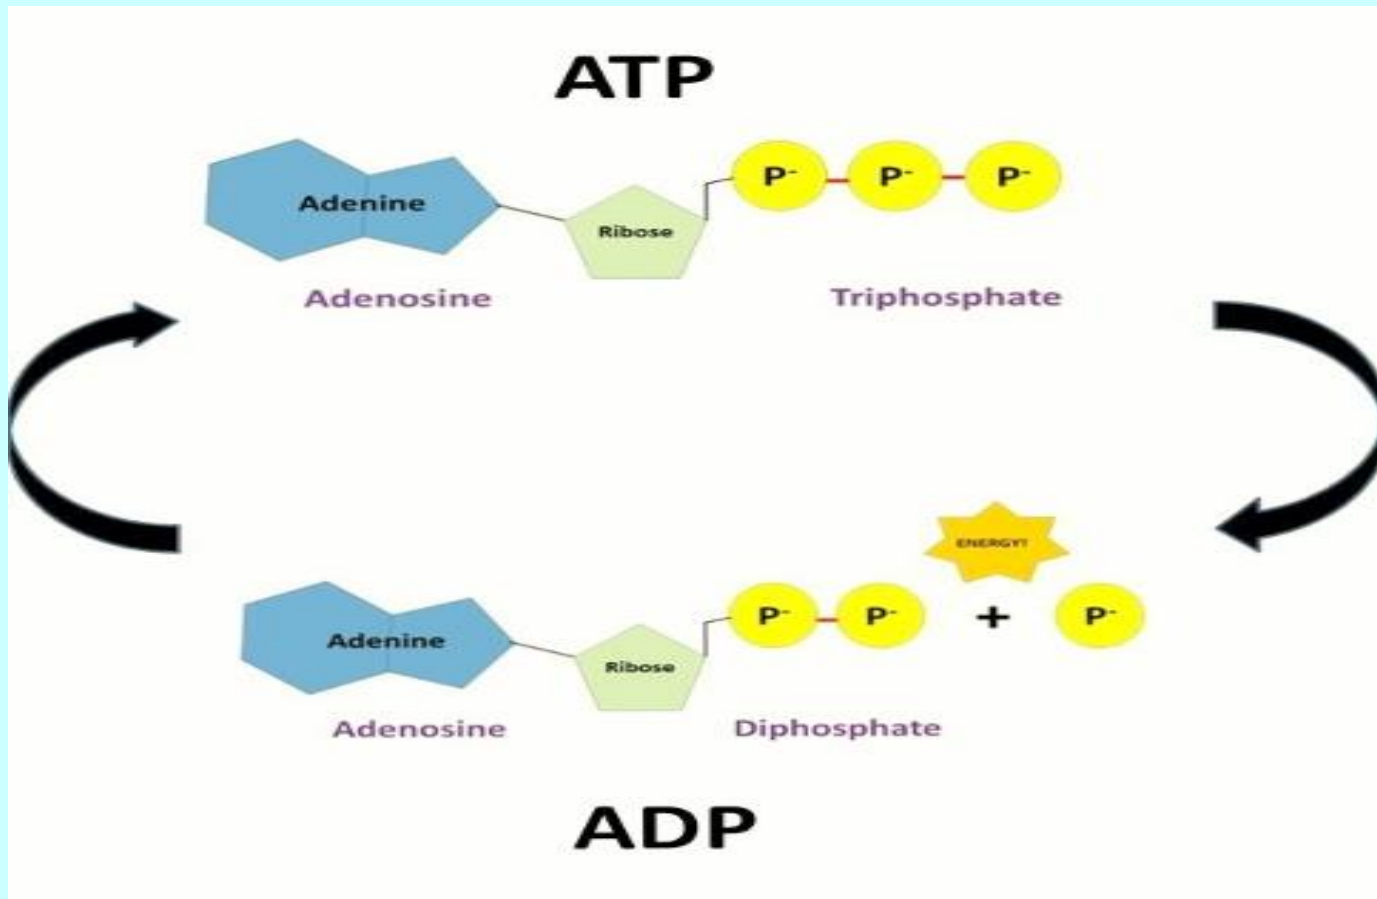

WATER

KINDS OF TRANSPORT

ACTIVE transport (requires energy from ATP)

Moves molecules from low concentration to high

Kinds of ACTIVE Transport

• PUMPS

• Sodium-Potassium

• Proton

• Vesicles

• Endocytosis

• Exocytosis

Na⁺ and K⁺ PUMP

Animation from: http://www.lionden.com/cell_animations.htm

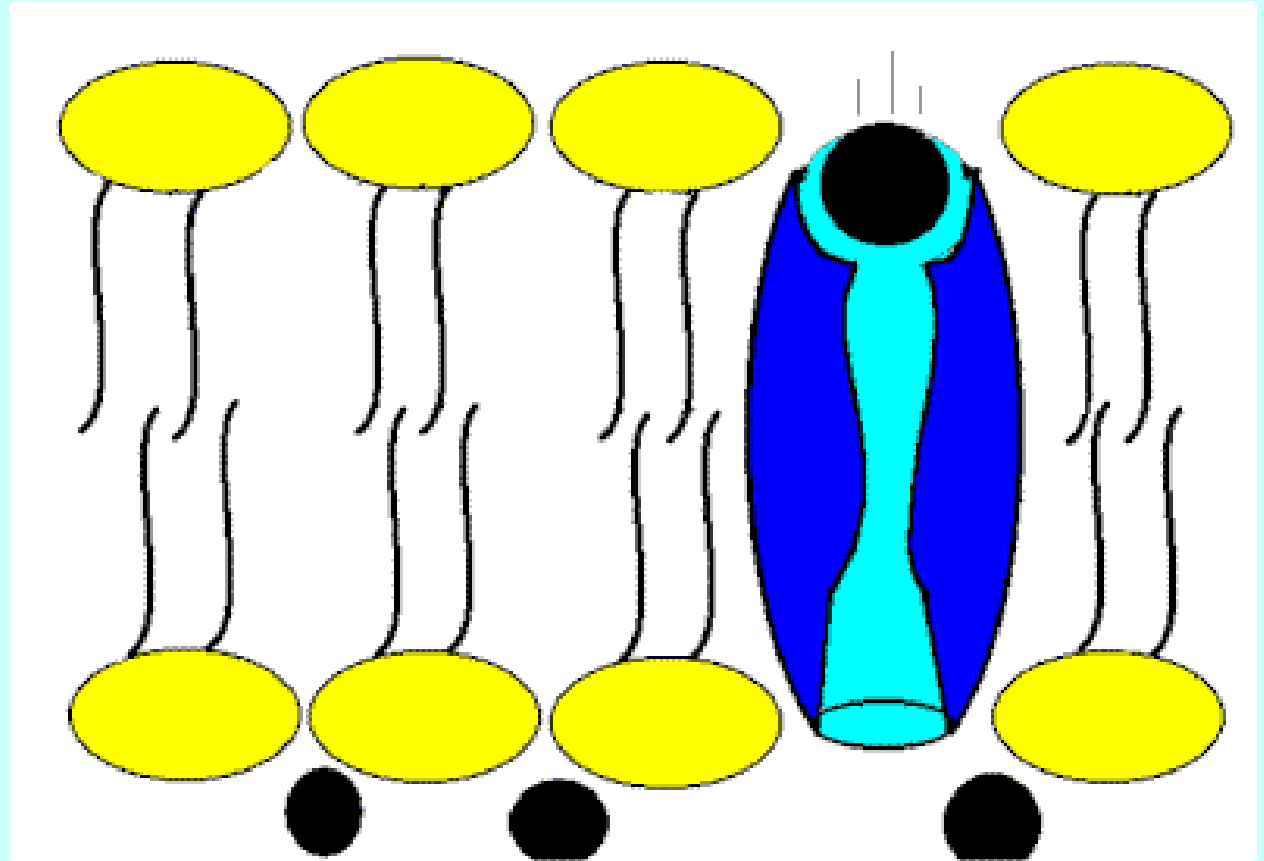

See a movie
about Na⁺ - K⁺ pump

SODIUM-POTASSIUM PUMP

- Special just for Na^+ and K^+ ions
-
- Example: transmission of signals in nerve cells
 - Na^+ is pumped out of cells at same time
 - K^+ is taken into cells

PROTON PUMP

Moves
Protons
across
membrane
= H^+ ions

More on this in Chap 8 & 9

[See a movie](#)
proton pump

PROTON PUMP

- Special just for H^+ ions

-

Examples:

- Stomach need acidic conditions for digestion, has proton pumps that secrete H^+ ions to create HCL (hydrochloric acid)
- Photosynthesis/Respiration
(more on this to come in Ch 8 & 9)

ACTIVE TRANSPORT

with VESICLES

VESICLES are small membrane sacs that pinch off of cell membranes used by cells for transporting molecules

Used for transporting molecules:

If entering the cell = ENDOCYTOSIS

If exiting the cell = EXOCYTOSIS

2 KINDS of ENDOCYTOSIS

for taking substances into cell

If taking in:

fluid or small molecules = PINOCYTOSIS

large particles or whole cells = PHAGOCYTOSIS

ENDOCYTOSIS

Substances taken into cell

- ACTIVE transport (requires energy)
- Uses VESICLES to carry substances
- Can move molecules from low concentration to high

Examples in cells:

- one celled organisms eat this way
- white blood cells get rid of bacteria this way

ENDOCYTOSIS

Animation from: <http://academic.brooklyn.cuny.edu/biology/bio4fv/page/cell-movement.html>

Protist eating another

PHAGOCYTOSIS

White blood cell destroying germs

WHITE BLOOD CELL ENGULFING BACTERIA (Phagocytosis)

5 μm

EXOCYTOSIS

Substances released outside of cell

- ACTIVE transport (requires energy)
- Uses VESICLES to carry substances
- Can move molecules from low concentration to high
- Examples in cells:
 - GOLGI release packaged proteins
this way

GOLGI BODIES USE EXOCYTOSIS

Animation from: <http://www.franklincollege.edu/bioweb/A&Pfiles/week04.html>

[See a Golgi movie](#)

Videos from:

http://www.pleasanton.k12.ca.us/avhsweb/thiel/apbio/notes/chp8/exocytosis_endocytosis.mov

<http://trc.ucdavis.edu/biosci10v/bis10v/week2/endocytosis.mov>

VO CAB

SOLUTE = substance that is dissolved in a solvent to make a solution

SOLVENT = substance in which a solute is dissolved

CONCENTRATION = mass of
a solute in a given volume of
solution

The MORE molecules there are in a given
volume the GREATER the concentration

Use new vocab to make Koolaid

Solutes = Koolaid powder & sugar

Solvent = Water

Koolaid drink = solution

What if there is a difference in concentration but solute molecules can't move across a membrane?

Semipermeable membrane

WATER will move until concentration reaches equilibrium

See a video clip about
OSMOSIS -7B

See an animation
Osmosis1

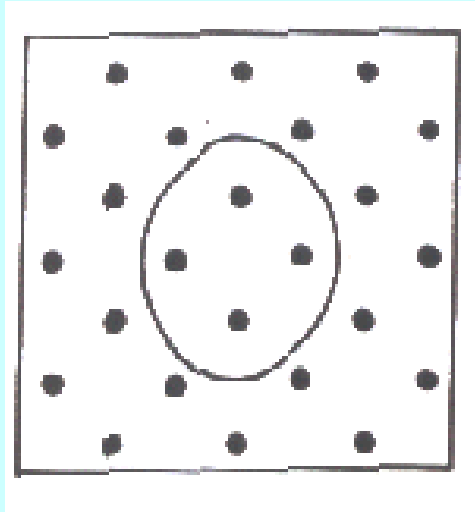

Animation

Solute concentration

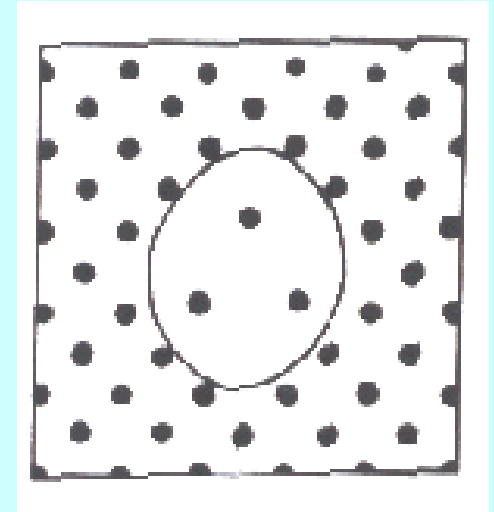

Lower outside
than inside

HYPOTONIC

Equal outside
and inside

ISOTONIC

Greater outside
than inside

HYPERTONIC

What will happen to an animal cell
placed in different solutions?

Remember:

Cells try to "maintain stable internal conditions =
HOMEOSTASIS

<http://bioweb.wku.edu/courses/biol121/Osmosis/Osmosis.asp>

So an animal cell in
ISOTONIC conditions
stays same size

0.9 % NaCl

Water entering = water leaving

[Video](#) Choose Blood Isotonic link

If cells can't maintain
"stable internal conditions" . . .
damage can result and cells can die.

OSMOSIS

See an animation
[Osmosis3](#)

[Video](#)

Choose Blood
Hypotonic link

HYPOTONIC:

Concentration outside cell is
LESS THAN inside the cell

More water enters than leaves cell so cell
will swell and possibly burst

OSMOSIS

See an animation
[OSMOSIS 4](#)

HYPERTONIC: Concentration outside cell is
GREATER THAN inside cell

More water leaves cell than enters
so cell shrinks

[Video](#)

Choose Blood
Hypertonic link

Animal cells

Cells placed in distilled water

Cells swell and burst

= **CYTOLYSIS**

Cells placed in concentrated salt solution

Cells shrink and shrivel

= **CRENATION**

Plant cells

Plant cell placed in distilled water

Cell stiffens but generally retains shape

Plant cell placed in concentrated salt solution

Cell body shrinks and pulls away from cell wall

CELL WALL keeps plant cells from bursting

= PLASMOLYSIS

VACUOLES store WATER

http://www.biology4kids.com/files/cell_vacuole.html

OSMOTIC PRESSURE =

Pressure exerted by the movement of water during osmosis

SO WHAT?

Bath water is
hypotonic
compared to you

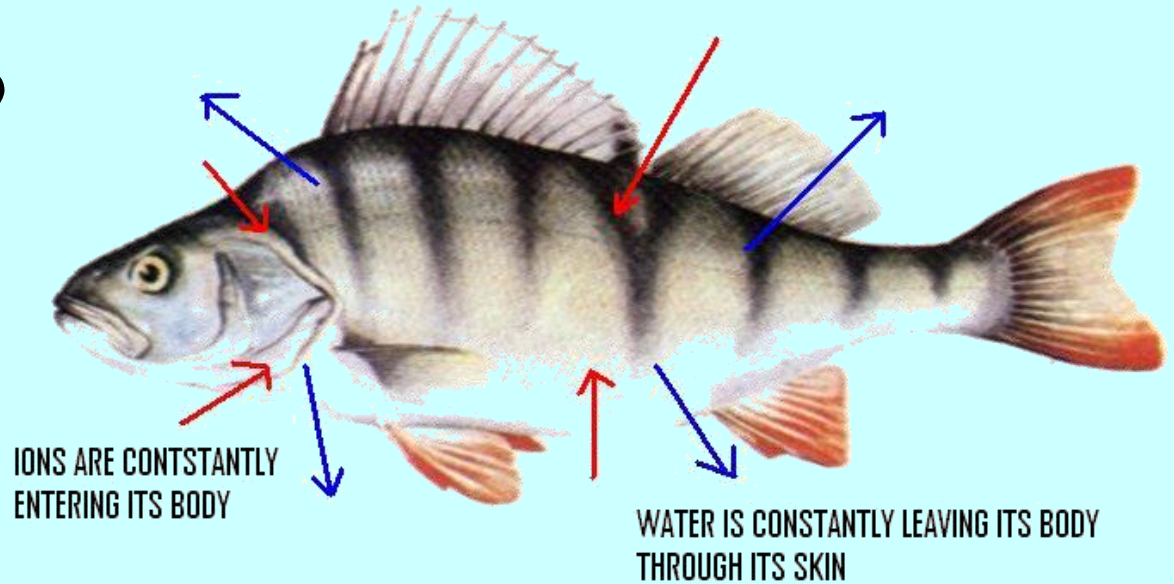

Sitting in the bathtub causes your fingers
and toes to wrinkle up when water
enters your skin cells by osmosis

Grocery stores spray water on their veggies to “plump them up”

A SALT WATER FISH LIVES IN A HYPERTONIC SOLUTION:

SO WHAT?

A FRESHWATER FISH LIVES IN A HYPOTONIC SOLUTION:
